MACHINE LEARNING: WHAT IS?

A FIRST STEP TO PRACTICAL MACHINE LEARNING

SIRAKORN LAMYAI

STUDENT, KASETSART U.

OCTOBER 30, 2018

ACKNOWLEDGEMENTS

Resources on this slides are mainly adapted and rearranged from

- W. Jitkrittum: Machine Learning Fundamentals I
- K. Muandet: Machine Learning Fundamentals II
- Google's Machine Learning Crash Course

BEFORE WE START...

Make sure these are installed on your computer.

- Python 3.6
- NumPy, Scipy, Matplotlib, Scikit-learn, MLxtend: Run pip install numpy scipy matplotlib sklearn mlxtend
- MNIST loader pip install git+https://github.com/datapythonista/mnist.git

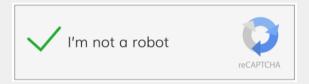

OUTLINE

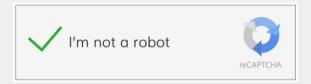

- 1 Introduction to Machine Learning
 - What is Machine Learning?
- 2 Machine Learning Problems
 - Supervised learning
 - Unsupervised learning
 - Reinforcement learning
- 3 Model
 - The Goal of Machine Learning
- 4 Machine Learning Process

- Evaluating Machine Learning Performance
- 5 Algorithms for Machine Learning Classification Problem
- 6 Problems for Machine Learning
 - Handwriting recognition
- 7 Neural Networks
- 8 Challenges in Machine Learning Problems
- 9 Your next step into Machine Learning
- 10 Questions and Answers

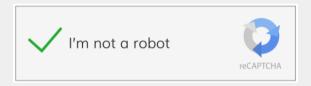

INTRODUCTION TO MACHINE LEARNING

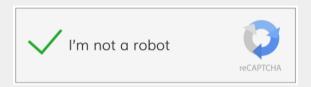

■ This is Recaptcha.

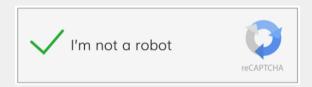

- This is Recaptcha.
 - ► Recaptcha helps stop millions of spam a day.

- This is Recaptcha.
 - Recaptcha helps stop millions of spam a day.
 - ▶ In some old days, we have to type Captcha texts to distinguish ourself from bots.

4 | 51

- This is Recaptcha.
 - ► Recaptcha helps stop millions of spam a day.
 - ▶ In some old days, we have to type Captcha texts to distinguish ourself from bots.
 - ► How is it possible that with a single click, an automated system can distinguish bots from humans?

MACHINE LEARNING

Machine **Learning**

Machine **Learning**

= Improves performance on a specific task.

MACHINE LEARNING PROBLEMS

Types of Machine Learning Problems

Types of Machine Learning problems

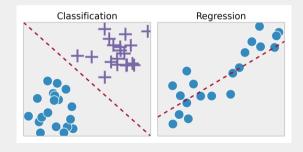

1. Supervised learning

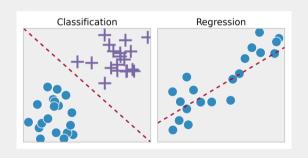

Types of Machine Learning problems

- 1. Supervised learning
- 2. Unsupervised learning

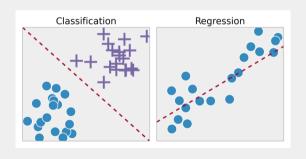

Types of Machine Learning problems

- 1. Supervised learning
- 2. Unsupervised learning
- 3. Reinforcement learning

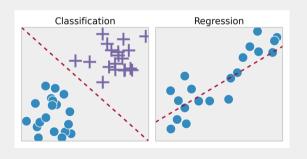

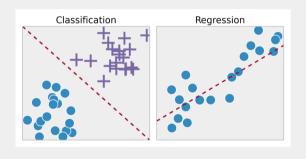

■ Given a **training set** for the data, find a **model** to **generalise** well to **unseen** data.

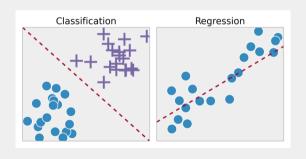

- Given a **training set** for the data, find a **model** to **generalise** well to **unseen** data.
- Two main supervised learning problems

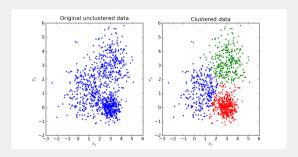

- Given a training set for the data, find a model to generalise well to unseen data.
- Two main supervised learning problems
 - ► Classification: On the discrete data

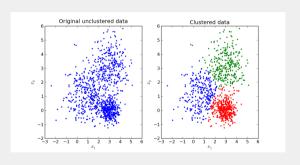

- Given a training set for the data, find a model to generalise well to unseen data.
- Two main supervised learning problems
 - ► Classification: On the discrete data
 - ► Regression: On the continuous data

- Given a **training set** for the data, find a **model** to **generalise** well to **unseen** data.
- Two main supervised learning problems
 - ► Classification: On the discrete data
 - ► Regression: On the continuous data
- Example problems: Spam E-mail detection, Facial recognition

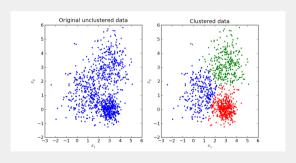

Unsupervised Learning

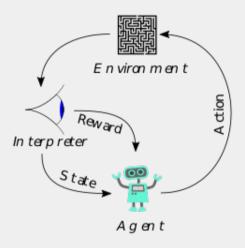

■ Discover hidden structure in non-labelled data.

Unsupervised Learning

- Discover **hidden** structure in **non-labelled** data.
- Example: Clustering, Generative models

REINFORCEMENT LEARNING

MODEL

■ A result of the combination between...

- A result of the combination between...
 - ► a **method** to recognise the data, and

MODEL

- A result of the combination between...
 - ► a **method** to recognise the data, and
 - ► sample datas for such the method

- A result of the combination between...
 - ▶ a **method** to recognise the data, and
 - ► sample datas for such the method

Data

MODEL

- A result of the combination between...
 - ▶ a **method** to recognise the data, and
 - ► sample datas for such the method

Determine which group should the purple dot be in (red/green/blue) by checking the colour of its nearest dot.

Data Method

THE GOAL OF MACHINE LEARNING

Generalise

THE GOAL OF MACHINE LEARNING

Generalise

■ We wants our model to know how does the **data pattern** looks like

Generalise

- We wants our model to know how does the **data pattern** looks like
- Our model should not "adhere" to one set of data, but instead knows the pattern of all the data.

Generalise

- We wants our model to know how does the **data pattern** looks like
- Our model should not "adhere" to one set of data, but instead knows the pattern of all the data.
- Therefore, we want our model to **generalise** over any set of data, given the small portion of data that we used to teach the model.

■ We're going to write our **first own** machine learning algorithm called **k-Nearest Neighbour** (k-NN)

- We're going to write our **first own** machine learning algorithm called **k-Nearest Neighbour** (k-NN)
 - ► k-NN is known to be very simple, with its concept as

- We're going to write our **first own** machine learning algorithm called **k-Nearest Neighbour** (k-NN)
 - \blacktriangleright k-NN is known to be very simple, with its concept as

k-NN algorithm

To classify label of a data point, get *k* nearest data points to the data point, and select the major label among those data points.

MACHINE LEARNING PROCESS

What is the bad way to choose k?

What is the bad way to choose *k*?

■ What if we choose k = # of all points?

What is the bad way to choose *k*?

- What if we choose k = # of all points?
 - ► What will happen if our dataset's got 3 labels of A, B, C with 10, 20, and 30 data points of each?

What is the bad way to choose *k*?

- What if we choose k = # of all points?
 - ► What will happen if our dataset's got 3 labels of A, B, C with 10, 20, and 30 data points of each?
 - Answer: Our model will always answer the labels with the highest data point count.

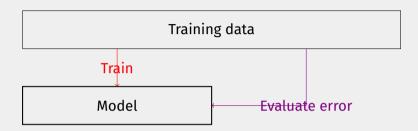

What is the bad way to choose *k*?

- What if we choose k = # of all points?
 - ► What will happen if our dataset's got 3 labels of A, B, C with 10, 20, and 30 data points of each?
 - Answer: Our model will always answer the labels with the highest data point count.
- What if we choose k = 1?

What is the bad way to choose *k*?

- What if we choose k = # of all points?
 - ► What will happen if our dataset's got 3 labels of A, B, C with 10, 20, and 30 data points of each?
 - Answer: Our model will always answer the labels with the highest data point count.
- What if we choose k = 1?
 - ► Let's try!

TRAINING ERROR

Loss function

$$L(y, \hat{y}) = \begin{cases} 0 & y = \hat{y} \\ 1 & y \neq \hat{y} \end{cases}$$

Error

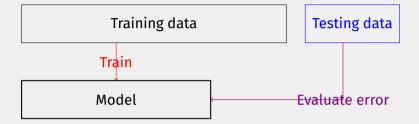

$$\sigma = \frac{1}{N} \sum_{i=0}^{N} L(y_i, \hat{y}_i)$$

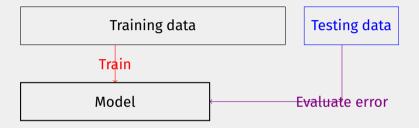

1/

■ Evaluating error with a data points that our model had already seen is bad.

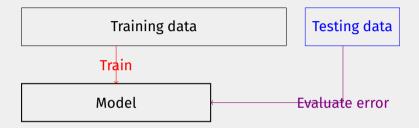

- Evaluating error with a data points that our model had already seen is bad.
- Why? Because our model already knows the answer to that data point! It could just simply answer by looking at the "answer key"

- Evaluating error with a data points that our model had already seen is bad.
- Why? Because our model already knows the answer to that data point! It could just simply answer by looking at the "answer key"
- So how should we evaluate our model?

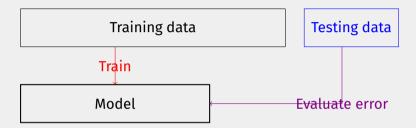

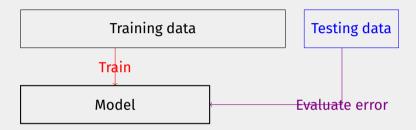

■ We separate our dataset into 2 parts: the **training set** and **testing set**

- We separate our dataset into 2 parts: the **training set** and **testing set**
 - Our model sees the correct label of the training set, but not the testing set.

- We separate our dataset into 2 parts: the **training set** and **testing set**
 - Our model sees the correct label of the training set, but not the testing set.
 - ▶ We all know the correct label of both the training and testing set.

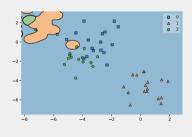

- We separate our dataset into 2 parts: the **training set** and **testing set**
 - Our model sees the correct label of the training set, but not the testing set.
 - ► We all know the correct label of both the training and testing set.
 - ► Teach our model with the training set, see how it performs with the testing set.

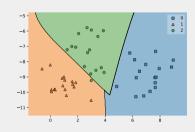

Choosing the best k

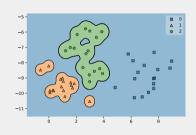

What will happen if...

- our *k* is too small?
- our *k* is too large?

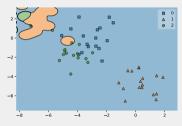

Which decision region is good?

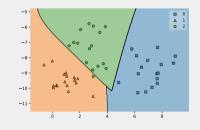

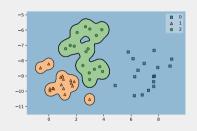

Which decision region is good?

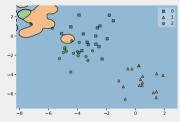

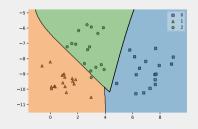

Underfit: The model fails to recognise data pattern

Which decision region is good?

Underfit: The model fails to recognise data pattern

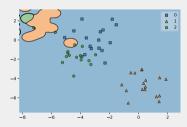

Overfit: The model remembers data pattern instead of generalising.

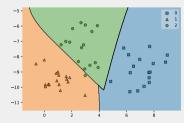

5

-10

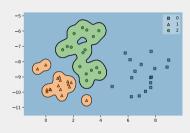

Which decision region is good?

Underfit: The model fails to recognise data pattern

Good fit: The model recognises data pattern **generally**

Overfit: The model **remembers** data pattern instead of generalising.

Good model must generalise

It's not only k that we can adjust.

It's not only *k* that we can adjust.

■ Actually, the key point in *k*-NN algorithm is choosing *k* points with the least **distant**.

It's not only *k* that we can adjust.

- Actually, the key point in *k*-NN algorithm is choosing *k* points with the least **distant**.
- What is **distant**?

Norm

In linear algebra, a **norm** is a function that assigns a strictly positive length or size to each vector in a vector space - except for the zero vector, which is assigned a length of zero.

Norm

In linear algebra, a **norm** is a function that assigns a strictly positive length or size to each vector in a vector space - except for the zero vector, which is assigned a length of zero.

Given \vec{x} as an N-dimension vector of $\begin{bmatrix} x_1 & x_2 & \dots & x_n \end{bmatrix}$

Norm

In linear algebra, a **norm** is a function that assigns a strictly positive length or size to each vector in a vector space - except for the zero vector, which is assigned a length of zero.

Given \vec{x} as an N-dimension vector of $\begin{bmatrix} x_1 & x_2 & \dots & x_n \end{bmatrix}$

$$\blacksquare$$
 l_1 Norm: $|x|_1 = \sum_{i=0}^N |x_i|$ (Manhattan)

Norm

In linear algebra, a **norm** is a function that assigns a strictly positive length or size to each vector in a vector space - except for the zero vector, which is assigned a length of zero.

Given \vec{x} as an N-dimension vector of $\begin{bmatrix} x_1 & x_2 & \dots & x_n \end{bmatrix}$

- \blacksquare l_1 Norm: $|x|_1 = \sum_{i=0}^N |x_i|$ (Manhattan)
- l_2 Norm: $|\mathbf{x}|_2 = \sqrt{\sum_{i=0}^N x_i^2}$ (Euclidian)

Norm

In linear algebra, a **norm** is a function that assigns a strictly positive length or size to each vector in a vector space - except for the zero vector, which is assigned a length of zero.

Given \vec{x} as an N-dimension vector of $\begin{bmatrix} x_1 & x_2 & \dots & x_n \end{bmatrix}$

- \blacksquare l_1 Norm: $|x|_1 = \sum_{i=0}^N |x_i|$ (Manhattan)
- l_2 Norm: $|\mathbf{x}|_2 = \sqrt{\sum_{i=0}^N x_i^2}$ (Euclidian)
- \blacksquare l_p Norm: $|x|_p = \left(\sum_{i=1}^n |x_i|^p\right)^{1/p}$ (Minkowski)

ALGORITHMS FOR MACHINE LEARNING CLASSIFI-

CATION PROBLEM

k-NN is a very simple intuition for machine learning algorithms. However, there exists more algorithm that performs well to other problems.

k-NN is a very simple intuition for machine learning algorithms. However, there exists more algorithm that performs well to other problems. Example algorithms:

■ Naïve Bayes

- Naïve Bayes
- SVM

- Naïve Bayes
- SVM
- Decision Tree

- Naïve Bayes
- SVM
- Decision Tree
- Logistic Regression

	Gender	Hair
1	М	Long
2	M	Short
3	F	Long
4	F	Long
5	F	Short

Can we guess the gender from hair's length?

	Gender	Hair
1	М	Long
2	M	Short
3	F	Long
4	F	Long
5	F	Short

Can we guess the gender from hair's length?

Bayes Theorem

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{P(B|A) \times P(A)}{P(B)}$$

	Gender	Hair
1	М	Long
2	M	Short
3	F	Long
4	F	Long
5	F	Short

Can we guess the gender from hair's length?

Bayes Theorem

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{P(B|A) \times P(A)}{P(B)}$$

	Gender	Hair
1	М	Long
2	M	Short
3	F	Long
4	F	Long
5	F	Short

Can we *guess* the gender from hair's length?

■ $P(\text{Male}|\text{Long hair}) = \frac{1}{3}$

Bayes Theorem

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{P(B|A) \times P(A)}{P(B)}$$

	Gender	Hair
1	M	Long
2	M	Short
3	F	Long
4	F	Long
5	F	Short

Can we guess the gender from hair's length?

- $P(\text{Male}|\text{Long hair}) = \frac{1}{3}$
- $P(\text{Female}|\text{Long hair}) = \frac{2}{3}$

Bayes Theorem

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{P(B|A) \times P(A)}{P(B)}$$

	Gender	Hair
1	М	Long
2	М	Short
3	F	Long
4	F	Long
5	F	Short

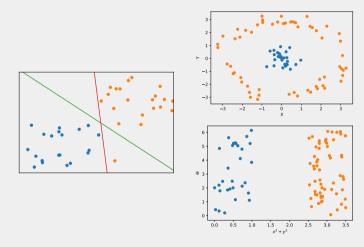

Bayes Theorem

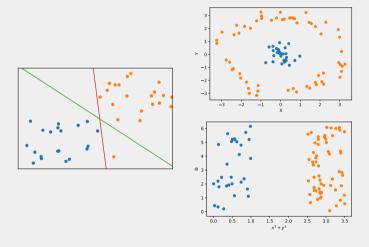

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{P(B|A) \times P(A)}{P(B)}$$

Can we guess the gender from hair's length?

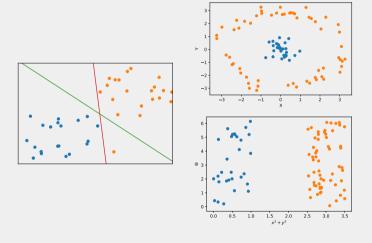

- $P(\text{Male}|\text{Long hair}) = \frac{1}{3}$
- $P(\text{Female}|\text{Long hair}) = \frac{2}{3}$

Therefore, we guess that the long-haired person is more likely to be a female.

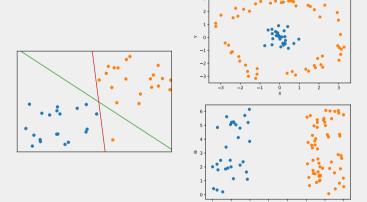

■ Goal: to draw a line to separate groups of data

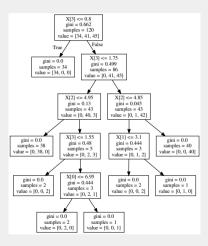

- Goal: to draw a line to separate groups of data
- Ideal good line: maximising the distant between the line and classes of data points

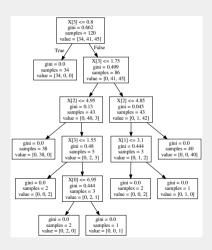

- Goal: to draw a line to separate groups of data
- Ideal good line: maximising the distant between the line and classes of data points
- What if the data is not linearly separable? Kernel tricks

DECISION TREE

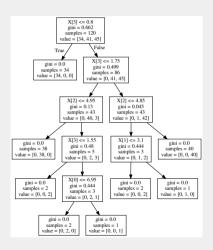

DECISION TREE

■ Creating an if-else conditions automatically

DECISION TREE

- Creating an if-else conditions automatically
- Nested conditions with a parameter to determine how does the separating of the "tree" performs.

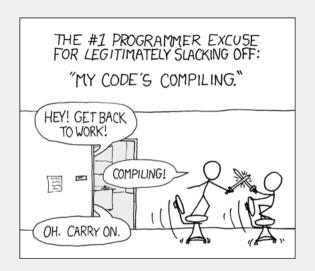

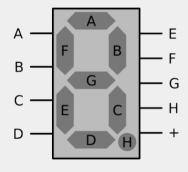

Figure: xkcd - Compiling

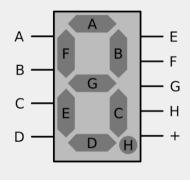

Figure: xkcd - Compiling (shamelessly modified)

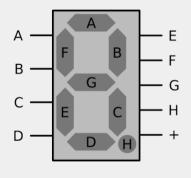

PROBLEMS FOR MACHINE LEARNING

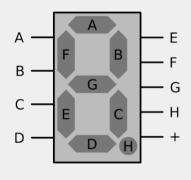

■ This is a 7-segment display.

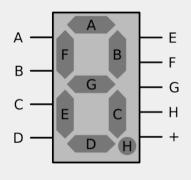

- This is a 7-segment display.
- It consists of a bulb labelled from A-G that could form a number.

- This is a 7-segment display.
- It consists of a bulb labelled from A-G that could form a number.

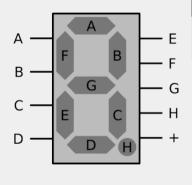

Problem

When the list of the bulb that went on were given, can we determine the number?

Problem

When the list of the bulb that went on were given, can we determine the number?

Problem

When the list of the bulb that went on were given, can we determine the number?

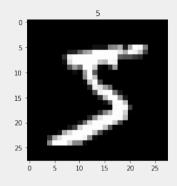

Not only yes, but easily yes!

```
if led_on == (b, c):
    return 1
elif led_on == (a, b, g, e, d):
    return 2
```

29

. . .

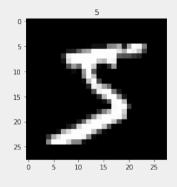

HANDWRITING

Problem

When the image of the handwriting were given, can we determine the number?

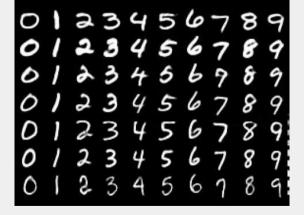

HANDWRITING

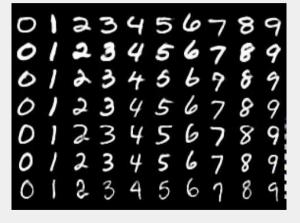

Problem

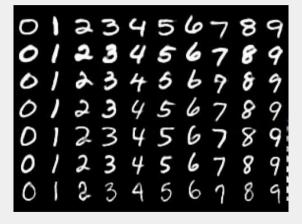

When the image of the handwriting were given, can we determine the number?

With an **explicit algorithm**? Obviously no! There are too many ways of drawing the number!

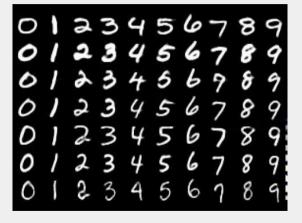

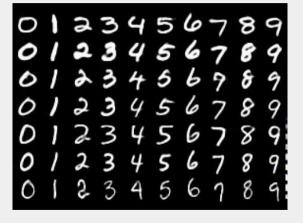

■ 28*28 pixel images of handwritten numbers (0-9)

- 28*28 pixel images of handwritten numbers (0-9)
 - ► Later to be viewed as a vector of 784 dimensions

- 28*28 pixel images of handwritten numbers (0-9)
 - ► Later to be viewed as a vector of 784 dimensions
- 60,000 training images

- 28*28 pixel images of handwritten numbers (0-9)
 - Later to be viewed as a vector of 784 dimensions
- 60,000 training images
- 10,000 testing images

k-NN with MNIST

k-NN WITH MNIST

■ Training: Pretty fast, no calculations on training phase

k-NN with MNIST

- Training: Pretty fast, no calculations on training phase
- Testing: *thinking*

k-NN with MNIST

- Training: Pretty fast, no calculations on training phase
- Testing: *thinking*
 - ► 60,000 data points to calculate the distant + 10,000 data points to test

k-NN WITH MNIST

- Training: Pretty fast, no calculations on training phase
- Testing: *thinking*
 - ▶ 60,000 data points to calculate the distant + 10,000 data points to test
 - ► = 600,000,000 calculations to be made (this excludes sorting, of which is a $\mathcal{O}(n)$ process)

k-NN with MNIST

- Training: Pretty fast, no calculations on training phase
- Testing: *thinking*
 - ▶ 60,000 data points to calculate the distant + 10,000 data points to test
 - ► = 600,000,000 calculations to be made (this excludes sorting, of which is a $\mathcal{O}(n)$ process)
 - ► = (relatively) slow

k-NN WITH MNIST

- Training: Pretty fast, no calculations on training phase
- Testing: *thinking*
 - ▶ 60,000 data points to calculate the distant + 10,000 data points to test
 - ► = 600,000,000 calculations to be made (this excludes sorting, of which is a $\mathcal{O}(n)$ process)
 - ► = (relatively) slow
- Good results with k-NN were achieved. (k-NN w/ non-linear deformation (P2DHMDM), preprocessed with shiftable edges, results into 0.52% error rate.)

SVM WITH MNIST

SVM WITH MNIST

■ Training: Slow as hell.

Trust me, I've tried.

SVM WITH MNIST

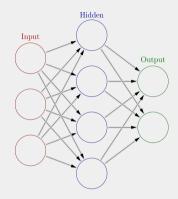

■ Training: Slow as hell.

Trust me, I've tried.

■ Good results with SVM were achieved. (Virtual SVM, deg-9 poly, 2-pixel jittered with deskewing preprocessing results into 0.56% error rate.)

NEURAL NETWORKS

ARTIFICIAL NEURAL NETWORKS (ANN)

This seems complex, right? We'll get start a little by little...

Figure: Neural network (Courtesy: Glosser.ca from Wikimedia Commons)

NEURONS

Figure: "Neurons" chandelier installed at Princh Mahidol Hall, Nakhon Pathom, Thailand (Courtesy: LASVIT's promotion video)

NEURON

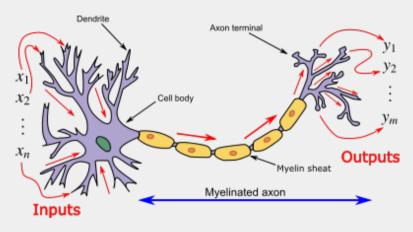

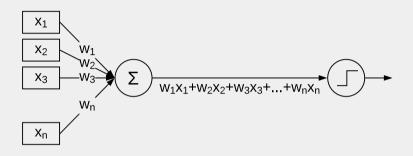

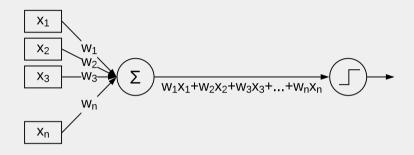

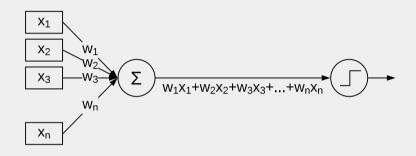

Figure: Neuron (Courtesy: Egm4313.s12 from Wikimedia Commons)

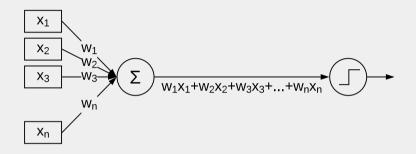

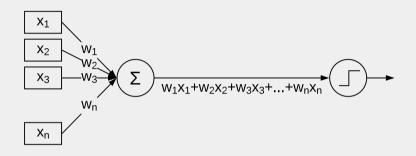

■ **Inputs** consisting of *n* inputs from x_1 , x_2 ... to x_n .

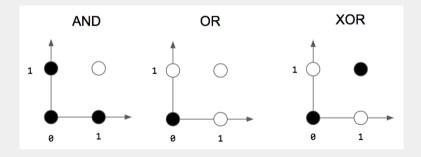

- **Inputs** consisting of *n* inputs from $x_1, x_2 \dots$ to x_n .
- Weights of each inputs, namely w_1 , w_2 , ..., w_n

- **Inputs** consisting of *n* inputs from $x_1, x_2 \dots$ to x_n .
- Weights of each inputs, namely w_1 , w_2 , ..., w_n
- **Summation** of all the weighted inputs $\Sigma = w_1x_1 + w_2x_2 + \ldots + w_nx_n$

- **Inputs** consisting of *n* inputs from $x_1, x_2 \dots$ to x_n .
- Weights of each inputs, namely w_1 , w_2 , ..., w_n
- **Summation** of all the weighted inputs $\Sigma = w_1x_1 + w_2x_2 + \ldots + w_nx_n$
- **Activation function** in either the form of $\Sigma > k$ or $\Sigma < k(nonlinear)$

AND gate OR gate XOR gate

AND gate

$$f: \Sigma \geq 2$$

OR gate

XOR gate

AND gate

OR gate

- $\blacksquare f: \Sigma \geq 1$

XOR gate

AND gate

- $\blacksquare f: \Sigma \geq 2$

OR gate

- $\blacksquare f: \Sigma \geq 1$

XOR gate Why can't XOR gate be created using a perceptron?

LINEARLY SEPARABLE PROBLEM

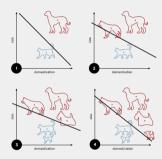

Figure: Linearly Separable Problem (Courtesy: Elizabeth Goodspeed from Wikimedia Commons)

- Now our problem is that the perceptron is a **linear classifier**, that means it could only separate datas that is linearly separable.
- Real-world problems are not that easy to separate
- How can we solve this problem?

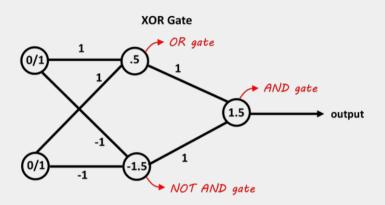

Figure: XOR gate with Perceptrons connected together (Courtesy: Parth Udawant)

How are the weights of each dendrites (inputs) are automatically adjusted?

How are the weights of each dendrites (inputs) are automatically adjusted?

■ Through a **backpropagation** Process

How are the weights of each dendrites (inputs) are automatically adjusted?

- Through a **backpropagation** Process
 - ► Initiate weights randomly

ARTIFICIAL NEURAL NETWORKS

How are the weights of each dendrites (inputs) are automatically adjusted?

- Through a **backpropagation** Process
 - ► Initiate weights randomly
 - ► Calculate the error over the training set

ARTIFICIAL NEURAL NETWORKS

How are the weights of each dendrites (inputs) are automatically adjusted?

- Through a **backpropagation** Process
 - ► Initiate weights randomly
 - ► Calculate the error over the training set
 - Attempts to adjust weights little by little to minimise loss

ARTIFICIAL NEURAL NETWORKS

How are the weights of each dendrites (inputs) are automatically adjusted?

- Through a **backpropagation** Process
 - ► Initiate weights randomly
 - Calculate the error over the training set
 - Attempts to adjust weights little by little to minimise loss

(Seriously, one day it will converge. There exists a mathematical proof)

Accuracy

Accuracy

■ Think 87% is good?

Accuracy

- Think 87% is good?
- Thailand's postal code consists of 5 digits

Accuracy

- Think 87% is good?
- Thailand's postal code consists of 5 digits
- If we need to reconise all the digits correctly, then the probability that one letter/parcel's postal code will be correctly recognised is

$$0.87^5 = 0.4984$$

Accuracy

- Think 87% is good?
- Thailand's postal code consists of 5 digits
- If we need to reconise all the digits correctly, then the probability that one letter/parcel's postal code will be correctly recognised is

$$0.87^5 = 0.4984$$

■ More than half of the letter/parcel's postal code will be wrongly labelled!

Accuracy

- Think 87% is good?
- Thailand's postal code consists of 5 digits
- If we need to reconise all the digits correctly, then the probability that one letter/parcel's postal code will be correctly recognised is

$$0.87^5 = 0.4984$$

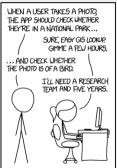

- More than half of the letter/parcel's postal code will be wrongly labelled!
- Can we do better? How?

Accuracy

- Think 87% is good?
- Thailand's postal code consists of 5 digits
- If we need to reconise all the digits correctly, then the probability that one letter/parcel's postal code will be correctly recognised is

$$0.87^5 = 0.4984$$

- More than half of the letter/parcel's postal code will be wrongly labelled!
- Can we do better? How?
- \blacksquare Error rate of 0.35% were achieved by neural networks for the MNIST problem.

IN CG, IT CAN BE HARD TO EXPLAIN THE DIFFERENCE BETWEEN THE EASY AND THE VIRTUALLY IMPOSSIBLE.
